Haz Heating in Plastic

Sometimes hazardous area heating involves using plastic drums. There are limited options for this type of heating in plastic in any form. However, customers are waking up to the use of the Faratherm Induction Base Heater, and the Intelliheat drum jacket.

One such need at the Reckitt Benckiser Aerosol Plant resulted in a decision to use the Faratherm because of its flexibility being able to handle a variety of drum sizes. Another application for Acetic Acid at the Royal Australian Mint better suited the use of Intelliheat for 205 litre plastic drums.

Although neither of these heating products has a thermostat due to electrical limitations in Zones 1&2, both have self-limiting properties. SBH Solutions can assist with advice and selection of product to suit a customer's application, backed up by LMK Thermosafe's unsurpassed technical knowledge in this specialized area.
